

Catapult

Making the catapult is pretty simple and putting it together should only take a couple of minutes.

1. Make sure you have all the parts required, these are two side pieces, a bottom piece, three cross struts a launching arm and an elastic band.
2. Lay one of the side pieces on a flat surface and glue the bottom piece into the large slot, it should be fitted so the band slots are towards the back of the catapult.
3. Glue the cross struts into the smaller slots, these are all the same size so it doesn't matter which goes in each slot.
4. Put the launching arm strut through the round hole, this should not be glued in place. Make sure end with hole in is towards the back of the catapult.
5. Glue the other side piece to the bottom piece and three struts making sure everything lines up into the slots. The launching arm strut goes through the hole in the side piece.
6. Once the glue has dried, hook the elastic band over the two hooks on the launching arm and under the catapult and hook it around the bottom pieces' slots.

Your catapult should now be ready for action.
